Congratulations on purchasing Pingcord! Enjoy pinging servers! Now here's a couple of easy steps to get you started.
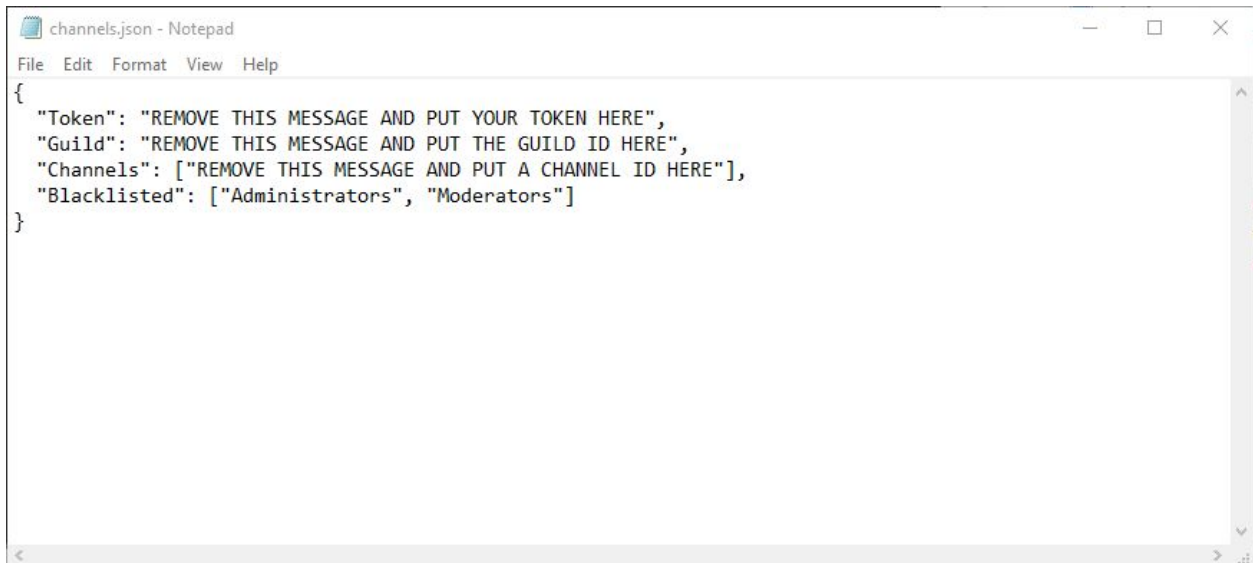

Now, you might be a little confused. But it won't be confusing as soon as you are done.

Go to your Pingcord folder, and find the "channels.json" file. This is how "griefcord.exe" will get information to which server to ping.
**And what channels to ping.**

**Open "channels.json" in any text editor.**

This is how it should look like in Notepad, don't worry. There's nothing wrong at all. This is just a JSON source file of again, interacting with Griefcord.exe.

So, before you can get to the fun stuff, we'll have to set it up so Griefcord knows which server to ping, and which channels to do it from.

So, go to your Discord settings and go to "Appearance" and scroll down until you see "Developer Mode"

Turn on Developer Mode, and now you are ready to begin.

After you turned on Developer Mode, go to any server of your choice and right-click it. This will now give you the option to "Copy ID" in the dropdown menu once you right-click. Copy this down, put it in the Guild option of your "channels.json"

Your Guild option of your channels.json should look like this. (Of course, not the exact same since all Guild numbers are different.)

Now, do the exact same thing with channels.

And do this manually with every channel. And add it to the "Channels" option.

For multiple, it should be like this
"Channels": ["NUMBER1", "NUMBER2", "NUMBER3"]
Add a comma, before the second one.

Blacklisted is just roles you want to avoid pinging. So, for example "Moderator" and "Admin" would be a good role to blacklist since they have action to ban you. And you don't want that. There's nothing worse than ruining fun.

__Before you open Griefcord.exe, make sure you also put your token.__

How To Get Your Discord Token
Press CTRL + Shift + I (This works on the Desktop Client & Online also.)
Go to the "Network" tab.
Now, type something randomly in any part of Discord. (Not in Network)
Once you typed something, there should be a "typing" in the Network.

Press "typing" > Once that is done. There should be a small "Headers" tab. Press that and scroll down until you see "Authorization"

It should look like this
Authorization: NDmdS08ASIDASJIAS
It'll just look like a code.
Be careful with that code, because that is your Discord Token. Sharing that could give anyone access to your Discord Account. Be very careful.

Now, copy that token and put it into the "Token" option of channels.json.

After that.

You are done and set!
Make sure to save channels.json and open up Griefcord.exe!

Now, it should be a Command Line window and it'll just be black.
It'll do the work and you won't even know. But it will say errors if anything has gone wrong.

(Like you've gotten banned, or have no internet access, or etc, or error in the code)

If for some very odd reason, things don't work or you are confused. Please contact me on Discord or Nulled.to.
